

SafeRun

An AI co-pilot that trades for crypto beginners with built-in guardrails

The Problem & Our Solution

Beginners want crypto exposure but are scared off by volatility, jargon, and scams. SafeRun makes trading safe, simple, and understandable.

- Beginners want crypto gains but fear volatility, jargon, and scams
- Manual trading demands chart literacy and constant attention beginners lack
- SafeRun: an AI co-pilot that trades within strict, user-set risk limits
- Every trade is explained in plain language, before and after execution
- Non-custodial session-key wallet keeps users fully in control of funds

How It Works

Users state a goal in plain English. SafeRun converts it into guarded on-chain trades, monitored and explained in real time.

- User sets a natural language goal like 'grow my SOL slowly with low risk'
- LLM parses the goal into concrete risk parameters and trading rules
- Session key signs scoped swap transactions via the Jupiter aggregator
- Anchor program enforces max trade size, daily loss cap, and auto-pause
- Pyth price feeds detect volatility spikes; dashboard logs every AI decision

Built with

Solana, Anchor, Solana wallet adapter,
Jupiter aggregator API, OpenAI/LLM
API, Pyth price feeds, Helius RPC

Why Now & What's Next

Solana's speed and mature session-key tooling finally make safe, real-time AI trading possible for everyday beginners.

- Fast, cheap Solana transactions make real-time AI-guided trades practical
- Session-key and account abstraction tooling is now mature enough to trust
- Next: support more assets and DeFi strategies like staking and LPing
- Next: community-audited risk templates for different beginner profiles
- Next: mobile app with push notifications and voice-based goal setting
